PROFESSIONAL SUMMARY

BS Cyber Security student at The Islamia University of Bahawalpur focused on offensive security — penetration testing, malware development and analysis, and OSINT. Active bug bounty hunter on Bugcrowd with hands-on experience across web application and network security testing. Daily Linux user on Arch Linux and other distributions, comfortable with system administration, hardening, and scripting. Builds security tools in Python, including a passive-first OSINT framework with a tamper-evident audit log and a fully offline, privacy-first AI voice assistant. Ready to bring an attacker's mindset and disciplined, ethical methodology to a red team or security engineering role.

TECHNICAL SKILLS

Offensive Security: Penetration Testing, Web App Security (OWASP Top 10), Network Pentesting, Vulnerability Assessment, Privilege Escalation, Bug Bounty

Malware & Reversing: Malware Development & Analysis, Reverse Engineering, Static & Dynamic Analysis, AV/EDR Evasion Concepts, Ghidra, x64dbg

Tools: Burp Suite, Nmap, Metasploit, Wireshark, Gobuster/ffuf, sqlmap, Hydra, John the Ripper, Hashcat

OSINT & Recon: Passive Reconnaissance, Subdomain & DNS Enumeration, Public API/Dataset Collection, Reporting & Audit Trails

Programming: Python (asyncio, FastAPI, Typer), Bash, C, C++, PowerShell, SQL/SQLite

Systems: Arch Linux, Kali Linux, Debian/Ubuntu, Fedora, systemd, Linux Hardening, Git/GitHub, Virtualization

EXPERIENCE

Bug Bounty Hunter / Security Researcher — *Bugcrowd — Remote*

Present

- Perform authorized security testing on in-scope targets of public bug bounty programs, following each program's rules of engagement and responsible disclosure policy.
- Conduct reconnaissance, vulnerability discovery, and proof-of-concept validation, and write clear, reproducible reports for security teams.

Linux Systems & Security Lab — *Self-Directed — Arch Linux & other distributions*

Present

- Install, configure, and maintain Arch Linux and other Linux systems from scratch, including package management, systemd services, networking, and user permissions.
- Build and maintain a home lab for practicing exploitation, privilege escalation, malware analysis, and system hardening in isolated environments.

SELECTED PROJECTS

Full list on github.com/TAHAMEO

OSINT Tool — Passive OSINT Collection & Reporting Framework — *Python, asyncio, Typer, FastAPI, SQLite*

- Built a modular, async, plugin-based OSINT tool that is passive-first and safe by default, collecting only public data from official APIs and public datasets.
- Designed a policy engine for authorization and scope checks, a hash-chained tamper-evident audit log, per-API rate limiting with retries and backoff, robots.txt compliance, and a TTL SQLite cache. github.com/TAHAMEO/OSINT_TOOL

14 (Fourteen) — Offline, Privacy-First AI Voice Assistant — *Python, Ollama, Whisper, Piper TTS, Linux*

- Developed a fully offline voice assistant with wake word, voice activity detection, Whisper speech-to-text, a local LLM with tool calling, and Piper neural text-to-speech — no cloud, no API keys, no telemetry.
- Engineered a security-focused plugin system with allowlists, permissions, and a native sandbox, plus an in-process network guard, optional encryption at rest, a native Linux installer, and 328 automated tests. github.com/TAHAMEO/14_AI

EDUCATION & CERTIFICATIONS
